

### **CAMERON PRESS**

The Cameron Press is a revolutionary machine for printing books. In fact, this machine, developed in 1968 by the research director of the Cameron Machine Company of New Jersey, Charles Haron, can print and bind a book without human intervention. While production-line printing was first invented by Stoud-Bridgeman, a Canadian Company, Charles Haron was the first to develop the automatic collation system that is a distinct feature of the Cameron Press. Currently, the various Cameron machines in use print more than 300 million books a year.
